FINAL RESULTS
SURVEY OF ONTARIO RESIDENTS

METHODOLOGY

The survey was conducted with 2,000 residents deemed 'travellers' under the screening criteria aged 18 and older from November 9th to 21st 2020. A random sample of panelists were invited to complete the survey from a set of partner panels based on the Lucid exchange platform. These partners are typically double opt-in survey panels, blended to manage out potential skews in the data from a single source.

In this report:

The margin of error for the visitors sample for a comparable probability-based random sample of the same size is +/- 4.9%, 19 times out of 20.

The margin of error for the residents sample for a comparable probability-based random sample of the same size is +/- 5.8%, 19 times out of 20.

The data were weighted according to census data to ensure that the sample matched Ontario's population according to age, gender, and region. Totals may not add up to 100 due to rounding.

Travellers are those who, prior to the COVID-19 pandemic, took at least one leisure trip a year, to a destination at least 40km from their residence.
